

LifeDesk

A persistent AI memory layer for your life

LifeDesk — Your Personal AI Ecosystem

1. The LifeDesk Ecosystem

LifeDesk acts as a central memory hub. Information from documents, devices, expenses, fixes, preferences and tasks can be connected so the assistant can retrieve context when needed.

LifeDesk — From Raw Information to Useful Action

2. From Information to Action

The core pipeline turns raw user information into structured memory, connects related facts, reasons over relevant context, and can produce an approved action.

3. Connected Memory Graph

A graph representation helps LifeDesk understand relationships rather than treating each note as an isolated record. This supports model-specific troubleshooting and long-term recall.

4. Example User Journey

The experience can move from a user-reported problem to relevant memory, exact context, a solution and a new confirmed memory.

5. Expansion Roadmap

A focused MVP can establish the memory loop before adding documents, warranties, expenses, subscriptions and proactive assistance.

6. Product Principle

LifeDesk should remember what remains useful, retrieve it at the right time, explain where it came from, and keep the user in control.
